

Aakash Auto Hub - Build Prompts

Aakash Auto Hub — Step-by-Step AI Build Prompts (Django)

How to use this file: - Ye prompts **Claude Code** (ya kisi bhi AI coding tool) me **ek-ek karke, order me** dena hai. - Pehle prompt se pehle, apna **PRD file (Aakash_Auto_Hub_PRD.pdf)** aur **logo (2 images)** attach/upload kar dena taaki AI ko poora context mile. - Ek prompt complete hone ke baad hi agla prompt dena — isse AI confuse nahi hoga aur code stable banega. - Har prompt ke end me likha “ Test before moving to next step” — usko follow karna, run karke dekhna, phir aage badhna.

PROMPT 0 — Context Setup (Sabse pehle ye bhejna, sirf ek baar)

Main tumhe ek PRD (Product Requirements Document) de raha hoon "Aakash Auto Hub" naam ki website ke liye — ye Bus & Car AC Parts ka digital catalog hai (Django me banana hai). Iske sath maine business ka logo bhi diya hai.

Poora project multiple steps me banayenge — main tumhe ek-ek karke prompt dunga, tum har step complete karke mujhe batana, aur agle step ka wait karna. Poora project ek hi baar me mat banana.

Ye pura project brief hai, isko dhyan se padho aur samajh lo — abhi kuch build mat karna, sirf confirm karo ki tumne samajh liya aur project structure ka rough plan batao:

[YAHAN PRD FILE ATTACH KARO]

Tech stack: Python Django, PostgreSQL (ya SQLite dev ke liye), Tailwind CSS.
UI theme: Navy blue (#0b1f4d), Black, Gold/Yellow accent (#f2b705) — jaisa mere business poster aur logo me hai (attach kar raha hoon), koi generic AI-generated template look nahi chahiye — custom, professional, automotive/industrial feel.

Confirm karo ki samajh gaye, phir main next prompt bhejunga.

 **Test before moving to next step:** AI ka plan padho, agar kuch missing lage to clarify kar do.

PROMPT 1 — Django Project Setup

Ab Django project setup karo:

1. Ek Django project banao naam "aakash_auto_hub"
2. Uske andar ye apps banao:
 - catalog (categories, products, images)
 - core (business info, static pages, home page)
3. requirements.txt banao jisme Django, Pillow, django-jazzmin (admin theme ke liye), aur baaki zaroori packages ho
4. Settings me: STATIC_URL, MEDIA_URL, MEDIA_ROOT properly configure karo taaki image uploads kaam kare
5. Ek clean folder structure banao (templates/, static/, media/ folders sahi jagah)
6. .gitignore file bhi add karo

Basic project run karke dikhado ki server chal raha hai.

 **Test before moving to next step:** `python manage.py runserver` chalao, default Django page dikhna chahiye.

PROMPT 2 — Database Models

Ab catalog app me ye models banao (PRD ke Data Model section ke hisaab se):

1. Category
 - name, slug (auto), icon_image, parent_category (self FK, nullable – subcategory ke liye), display_order, is_active
2. Product
 - name, slug (auto), part_number, description (rich text ho to acha), category (FK), sub_category (FK, nullable), compatible_models (text field), alternative_parts (ManyToMany to self, blank=True), is_active, is_featured, created_at
3. ProductImage
 - product (FK), image, is_primary (boolean)

Core app me:

4. BusinessInfo (singleton model – sirf ek hi row ho sake)
 - business_name, tagline, logo, about_text, phone_number, whatsapp_number, whatsapp_message_template (default: "Hi, I'm interested in {product_name} (Part No: {part_number}). Please share more details."), address, map_embed_link, instagram_url, facebook_url
5. EnquiryLog
 - product (FK), clicked_at (auto_now_add), source (choices: WhatsApp/Call)

Migrations banao aur run karo. Har model me `__str__` method aur zaroori Meta options (jaise ordering) bhi add karna.

✓ **Test before moving to next step:** `python manage.py makemigrations` && `python manage.py migrate` error free chalna chahiye.

PROMPT 3 — Admin Panel (Attractive & Owner-Friendly)

Ab admin panel setup karo jo owner khud use karega (non-technical person), isliye simple aur attractive hona chahiye:

1. django-jazzmin install aur configure karo – theme colors navy blue + gold rakho (mera business logo bhi admin panel me header pe dikhna chahiye)
2. Har model (Category, Product, ProductImage, BusinessInfo, EnquiryLog) ke liye proper ModelAdmin classes banao:
 - Product admin me: list_display me name, category, is_active, is_featured dikhe; list_filter category/is_active se; search_fields name aur part_number pe; ProductImage ko inline banao (product ke andar hi images add ho sake)
 - Category admin me: list_display, prepopulated_fields for slug
 - BusinessInfo ko singleton jaisa treat karo – admin me sirf ek entry allow ho (add button dusri baar disable ho jaye agar ek entry already hai)
 - EnquiryLog ko read-only rakho (owner sirf dekh sake, edit na kar sake) – isko dashboard me "most enquired products" jaisa dikhana hai
3. Admin panel ka dashboard thoda customize karo – welcome message aur quick stats (total products, total categories, total enquiries this month) dikhe

Ek superuser create karke mujhe dikhado admin panel kaisa dikh raha hai.

✓ **Test before moving to next step:** `python manage.py createsuperuser` karke `/admin/` open karo, sab kuch add/edit ho pa raha ho.

PROMPT 4 — Base Template, Header & Footer

Ab frontend design shuru karte hain. Pehle base template banao jisme:

1. base.html – jisme har page extend hoga
2. Tailwind CSS setup karo (CDN ya proper build – jo better ho)

3. Header banao:
 - Logo (left side)
 - Business name + tagline
 - Nav links: Home | Categories | About | Contact
 - Top pe ek thin bar me phone number aur WhatsApp icon (click-to-call/whatsapp)
 - Mobile pe hamburger menu
4. Footer banao:
 - Logo + short about text
 - Address
 - Contact: phone, whatsapp, email
 - Instagram aur Facebook icons (BusinessInfo model se links aayenge)
 - Popular categories quick links
 - "Genuine Parts | Best Price | Expert Service | Fast Delivery" trust badges (jaisa poster me hai)
 - Copyright line
5. Ek sticky/floating WhatsApp button banao jo har page ke bottom-right corner me fix rahe

Design brand colors follow kare: Navy blue (#0b1f4d), Black, Gold/Yellow (#f2b705). Koi generic Bootstrap-jaisa default look nahi chahiye – bold, automotive/industrial feel jaisa mere poster me hai (attach kiya hua hai). Font bold aur professional ho.

Header/footer ka data BusinessInfo model se dynamically aana chahiye (hardcoded nahi).

✓ **Test before moving to next step:** Koi bhi dummy page banake dekho ki header/footer sahi dikh raha hai, mobile responsive bhi ho.

PROMPT 5 — Homepage

Ab homepage banao (core app ki home view):

1. Hero/banner section – bold headline, tagline, "Free Delivery" jaisa poster me hai, background me bus/truck ka feel (illustration ya gradient use kar sakte ho)
2. Search bar – "🔍 Search Bus AC Parts" – jo search results page pe redirect kare
3. Category grid – sabhi active categories icon/image ke sath, 2-3 columns mobile pe, 4-6 columns desktop pe. Har card pe category name + icon, click karne pe category page khule
4. "Why Choose Us" section – 4 boxes: Genuine Parts | Best Price | Expert Service | Fast Delivery (icons ke sath, jaisa poster me hai)
5. Featured Products section (optional) – `is_featured=True` products ka horizontal scroll ya grid

Sab kuch database se dynamically load ho (categories admin panel se aayengi).

✓ **Test before moving to next step:** Admin panel se 2-3 categories add karke check karo ki homepage pe sahi dikh rahi hain.

PROMPT 6 — Category Page & Product Listing

Ab category page banao:

1. URL pattern: `/category/<slug>/`
2. Selected category ka naam heading me dikhe
3. Us category ke sabhi active products grid me dikhe – sirf image + product name (price kahin nahi dikhana – PRD me clearly mention hai price show nahi karni)
4. Agar sub-categories hain to filter chips/tabs dikhao (jaise "Compressor" category ke andar Sanden/Valeo/Denso/Bitzer filter)
5. Agar category empty hai (koi product nahi) to friendly empty-state message dikhao ("Products coming soon! Contact us on WhatsApp for availability" + WhatsApp button)
6. Pagination add karo agar products zyada hon (12-16 per page)

Design same brand colors follow kare, cards clean aur clickable hon (poora card clickable ho, sirf image nahi).

✓ **Test before moving to next step:** 5-6 dummy products add karke category page check karo.

PROMPT 7 — Product Detail Page + WhatsApp Integration

Ab product detail page banao (/product/<slug>):

Ye page ye sab dikhaye:

1. 🖼️ Product images – agar multiple images hain to gallery/carousel (thumbnail click se main image change ho)
2. 📄 Product name (heading)
3. 🏷️ Part Number (OEM)
4. 🏷️ Category badge
5. 📖 Full description
6. 🚗 Compatible Bus/Vehicle Models (agar diya hai to tags jaisa dikhao)
7. 🔗 Alternative/Related Parts – agar linked products hain to unke cards niche dikhao (clickable, us product pe le jaye)
8. Do bade buttons:
 - "📞 Enquire on WhatsApp" (primary button, gold/navy color) – click karne pe `https://wa.me/<whatsapp_number>?text=<encoded message>` khule naye tab me. Message template BusinessInfo model se aaye, usme {product_name} aur {part_number} automatically replace ho jaye
 - "📞 Call Now" button – tel: link, mobile pe direct call trigger kare
9. Jab bhi koi WhatsApp button click kare, backend me EnquiryLog create ho (product, source="WhatsApp", timestamp) – iske liye ek chota AJAX call ya view banao jo click hote hi log kare aur phir WhatsApp redirect ho (redirect me delay na ho, seamless experience chahiye)

✖ Price kahin bhi is page pe nahi dikhni chahiye.

Design clean aur mobile-first ho, kyunki zyadatar customers mobile se WhatsApp karenge.

✓ **Test before moving to next step:** Ek product open karke WhatsApp button test karo — sahi number pe sahi message ke sath khulna chahiye, aur admin panel me EnquiryLog entry create honi chahiye.

PROMPT 8 — Search Functionality

Ab search feature banao:

1. Header ke search bar se query submit hone pe /search/?q=<query> page khule
2. Search product name, part_number, aur description me match kare (icontains use karo)
3. Results wahi product-card grid style me dikhein jo category page pe hai
4. Agar koi result na mile to friendly message dikhao ("No parts found. Message us on WhatsApp, we'll help you find it!" + general WhatsApp enquiry button)
5. Search query ko log bhi kar sakte ho (optional) – future me pata chalega customers kya dhundh rahe hain jo catalog me nahi hai

✓ **Test before moving to next step:** Kisi product ka naam ya part number search karke check karo.

PROMPT 9 — Static Pages (About & Contact)

Ab ye static pages banao:

1. About Us page – BusinessInfo model ke about_text ke sath, business story/intro
2. Contact Us page –
 - Address (BusinessInfo se)
 - Phone / WhatsApp / Email (clickable)
 - Google Map embed (map_embed_link se)
 - Instagram/Facebook icons
 - Ek simple enquiry ke liye direct WhatsApp button bhi

Dono pages same header/footer/design language follow karein.

✓ **Test before moving to next step:** Dono pages open karke check karo sab data sahi dikh raha hai.

PROMPT 10 — SEO, Polish & Deployment Prep

Ab final polish karo:

1. Har page pe proper <title> aur meta description add karo (product page pe product name + part number se dynamic title banao — SEO ke liye zaroori hai)
2. Image alt text properly set karo (product name use karke)
3. Favicon set karo (logo se)
4. 404 aur 500 error pages ko bhi brand ke hisaab se design karo (generic Django error page na dikhe)
5. Django settings ko production-ready banao — DEBUG=False ke liye instructions, ALLOWED_HOSTS, static files collect karne ka process (collectstatic)
6. Ek README.md banao jisme:
 - Project setup steps
 - Environment variables list
 - Deployment steps (kisi Django-friendly host jaise Render/Railway ke liye)
 - Admin panel login kaise banayein

Sab kuch test karke confirm karo ki project deployment ke liye ready hai.

✓ **Test before moving to next step:** Poori site ek baar end-to-end browse karo — Home → Category → Product → WhatsApp click → Search → About/Contact.

Important Notes

- Agar kisi step me AI galat direction me jaye, to usko wapas PRD ka relevant section paste karke correct kar dena — poora prompt dubara mat dena, sirf jo galat hai wo point out karna.
- Har prompt ke baad `git commit` karne ki aadat dalo (agar Git use kar rahe ho) — taaki agar kuch break ho to easily wapas ja sako.
- Content upload (real product photos, descriptions, part numbers) Step 7 ke baad shuru kar sakte ho, isse pehle dummy/sample data se hi test karo.
- Agar tumhe koi step bahut bada lage AI ke liye, usko chhote sub-steps me tod sakte ho (jaise Prompt 7 ko “gallery” aur “WhatsApp button” alag-alag bhej sakte ho).
